INTRODUCTION

This report is part of the twentieth series of annual reports summarizing vital statistics in the State of New Jersey.

Statistics provided in this publication are summarized from items reported on birth certificates filed with the New Jersey State Registrar. New Jersey vital statistics legislation requires that within five days of birth the attending physician, midwife, or person acting as midwife, file a birth certificate with the local registrar to be submitted to the State Registrar. Births to New Jersey residents occurring in other states are recorded in the state of occurrence and forwarded to the New Jersey State Registrar. All individual identifiers are removed prior to tabulation of data for statistical purposes.

OVERVIEW

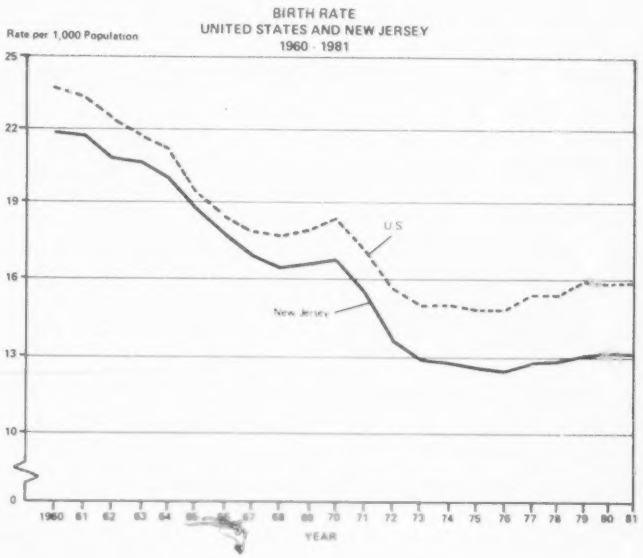
In both the nation and State, there was little change in the annual number of births from 1980 to 1981. The total number of births to New Jersey residents decreased less than one percent to 96,205 in 1981 from the eight-year high of 96,438 recorded in 1980. Nationwide, the number of births increased a slight one percent from 1980 to 1981.

The birth rate, the number of births per 1,000 population, is a measure of population increase. At 13.1, the State's birth rate was unchanged from the previous year. Camden County recorded the highest birth rate (16.1) and Bergen County the lowest (10.1). Counties with birth rates above the State average of 13.1 were: Cumberland (15.4), Sussex (15.2), Gloucester (15.0), Passaic (14.8), Salem (14.7), Hudson (14.5), Atlantic (13.9), Essex (13.4), and Ocean (13.3). Among New Jersey's major cities, with populations of 50,000 or more, Camden reported the highest rate, 23.9. Ranking second and third were Paterson and Trenton, with birth rates of 19.9 and 19.3, respectively.

The fertility rate, the number of births per 1,000 women 15-44 years of age, is a measure of childbearing patterns. The fertility rate for New Jersey fell to 56.8 in 1981, losing 0.2 points from the previous year and continuing the historical downward trend. During the past decade, the overall fertility rate has fallen nearly one-fourth.

Births out-of-wedlock in 1981 were recorded for one of every five births. Over the year, out-of-wedlock births remained at 21.1 percent of births for which legitimacy status was reported. For white women, the percentage of total births illegitimate increased 1.3 percentage points to 12.0 percent, while for nonwhite women, the percentage of births occurring out-of-wedlock decreased 0.8 percentage points to 55.7. Women 19 years and under gave birth to 38.2 percent of the children born out-of-wedlock. Nearly seventy percent of all births among women in this age group were illegitimate. The occurrence of illegitimate births to women over 35 years of age has been increasing. In 1970 4.5% of births to women in this age group were out-of-wedlock. The statistics for 1981 show 8.2 percent of the births in this group were illegitimate, an increase of 3.7 percentage points in a decade.

In 1981, 74,086 births were reported as white and 20,416 as nonwhite. Births unidentified by race numbered 1,703. White births were seventy-seven percent of all births, virtually unchanged from the previous year.



NEWBORN HEALTH

Birthweight

The median weight group for newborns was 6 lbs. 10 oz. to 7 lbs. 11 oz. Approximately thirty-seven percent of all newborns were included in this weight group.

Premature, or low birthweight newborns, are defined as weighing 5 lbs. 8 oz. (2,500 grams) or less. Of births for which weight was reported in 1981, 7.0 percent of newborns were low birthweight babies. White births weighing less than 5 lbs. 8 oz. numbered 4,133, 5.6 percent of all white births, while nonwhite immature births numbered 2,609, or 12.8 percent of all nonwhite births.

Births to young mothers under 20 years of age are likely to be immature. A total of 10.8 percent of births to teenage mothers were immature, numbering 1,205 in 1981. Among nonwhite teenage mothers, the number of births underweight was higher than for all teenage mothers and occurred at more than twice the rate for all births. Among nonwhite teenage mothers, 15.0 percent, 742 births, were underweight.

The number of previous pregnancy terminations a woman has had affects the incidence of low birthweight outcomes for subsequent pregnancies. The incidence of immature birth to women with no previous pregnancy terminations was 6.7 percent. The percentage of births immature increased with the number of previous terminations to a high of 15.6 percent of births for women with more than three previous terminations.

There is a positive relationship between birthweight and prenatal care. Low birthweight infants are born less frequently to women who begin prenatal care in the first trimester of pregnancy. The rate among this group was 6.4 percent of births. The percentage of immature births among mothers starting care during the second trimester of pregnancy was 8.6 percent, and among those beginning care in the third trimester, 9.5 percent. Those receiving no prenatal care gave birth to low birthweight infants in 21.8 percent of cases.

MATERNAL CHARACTERISTICS

Age

The median age group for mothers in 1981 was 25-29 years. Approximately one-third of all births were to women in this age group. Births to teenage women, 19 years and younger, accounted for 11.6 percent of the total, slightly lower than the proportion in 1980. Women 35 years of age and older gave birth to 6.1 percent of the newborns, nearly the same proportion as in the previous year.

Teenage deliveries were highest as a percentage of total births in Cumberland (24.1), Essex (18.4), Atlantic (18.2), and Salem (17.3) counties.

Race

Of total births, 74,086, 77.0 percent, were reported as occurring to white mothers and 20,416, 21.2 percent, to nonwhite mothers, approximately the same proportions as in the previous year. During the last decade the proportion of total births that were nonwhite has increased slightly, about one percent, while a comparable decrease has occurred for the proportion of total births that were were white. Births of unknown or unrecorded race numbered 1,703, 1.8 percent of all records.

Prenatal Care History

There were 964,478 visits for prenatal care, approximately 10.0 visits per patient, virtually unchanged from the 9.9 visits per patient in 1980. For women giving birth in 1981, 77.6 percent began prenatal care in the first trimester of their pregnancies and only 3.4 percent failed to receive care before the third trimester. Approximately 1.5 percent did not receive any prenatal care.

More white mothers began prenatal care in the first trimester than nonwhite mothers and fewer white mothers completed their pregnancies without any prenatal care. Of white mothers, 83.2 percent sought first trimester care, while among nonwhite mothers the percentage was 63.4. A slight 0.5 percent of white mothers did not receive any prenatal care while 3.6 percent of nonwhite women did not receive prenatal care for the duration of their pregnancies. Care for all age-race groups was lowest for nonwhite teenagers with fewer than one-half, 45.9 percent, receiving first trimester care and 5.7 percent not receiving any prenatal care.

First trimester care was least for mothers aged 15-19. Approximately one-half of the childbearing women in this age group, 5,519, received prenatal care from the first trimester of pregnancy. Of teenage mothers, 9.6 percent did not receive prenatal care before the third trimester of pregnancy. Attention to prenatal care increases with maternal age. First trimester care was received by 73.1 percent of the women aged 20-24 and by 85.0 percent of the women 25 years of age and older.

Apgar Score

The Apgar Score is a composite measure used to evaluate the newborn infant's general condition. The Apgar Scores are given to newborns at one and five minutes after birth. Heart rate, respiratory effort, color, muscle tone, and reflexes are checked and evaluated. Each factor receives a score of 0,1, or 2 and the sum of the five values is the overall score. A score of 10 is optimum. Newborns with scores less than 7 are considered distressed and are observed more closely for physical problems during the first days of life.

Approximately forty percent of newborns in 1981 received maximum Apgar Scores of 10 while only 1.5 percent were given scores less than 7. More than twice as many nonwhite newborns had low Apgar Scores as white newborns. Births to white mothers received Apgar Scores in the 0-6 point range 1.2 percent of the time, while nonwhite births were low score 2.7 percent of the time. When matched with age of mother, the incidence of low Apgar Score births were highest for teenage mothers and for women 45 years of age and over. Among births to women 19 years of age and under, 2.3 percent had low scores, while 3.0 percent of the births to women age 45 years and over were low score newborns. The percentage of newborns with low scores was 1.6 percent for mothers aged 20-44.

Low Apgar Scores occurred less frequently to mothers who received prenatal care. Of births among women beginning prenatal care during their pregnancies, 1.5 percent were in the 0.6 score range. Among mothers not receiving any prenatal care, over three times as many, 4.7 percent births, were low-score.

Attendant at Birth

A physician was in attendance at 97.8 percent of all residents births. Midwives attended 1,836 (1.9 percent) of all residents births in 1981, approximately the same number as in 1980. The percentage of white and nonwhite mothers assisted by midwives remained unchanged over the year at 1.3 and 4.4 percent, respectively. Of all midwife attended births, 963 were white, 811 were black, and 43 were other races.

DEFINITIONS

Apgar Score - composite measure used to evaluate the newborn infant's general condition. Apgar scores are given one and five minutes after birth. Heart rate, respiratory effort, color, muscle tone and reflexes are checked and evaluated. Each factor receives a score of 0, 1, or 2 and the sum of the five values is the overall score. A score of ten is optimum.

Birth Rate - the number of live births per 1,000 population.

Birthweight - weight of the infant at time of delivery.

Fertility Rate - the number of live births to women aged 15-44 per 1,000 women in this age group, usually expressed as an annual rate.

Illegitimate Birth - a birth to an unwed woman, or to a woman whose husband did not father the infant.

Immature Birth - a live birth weighing 2,500 grams, 5 lbs. 8 oz., or less.

Legitimate Birth - a birth to a married woman whose husband fathered the infant.

Residence - mother's place of residence.

Trimesters - 1st - first 12 weeks of pregnancy
2nd - second 12 weeks of pregnancy
3rd - period after first 24 weeks of pregnancy

INTRODUCTION

This report is part of the twentieth series of annual reports summarizing vital statistics in the State of New Jersey. Divorce statistics are being published for the first time with this issue.

Marriage statistics provided in this publication were tabulated from items reported on marriage certificates filed with the New Jersey State Registrar prior to July 1, 1982. Divorce data have been provided by the Superior Court, Chancery Division. Marriages and divorces are recorded by place of occurrence or judgment, so statistics refer to the number of events occurring within the State irrespective of the place of residence of the participants. All individual identifiers were removed prior to tabulation of data for statistical purposes.

Rates published in this report are based on 1980 census of population data.

OVERVIEW

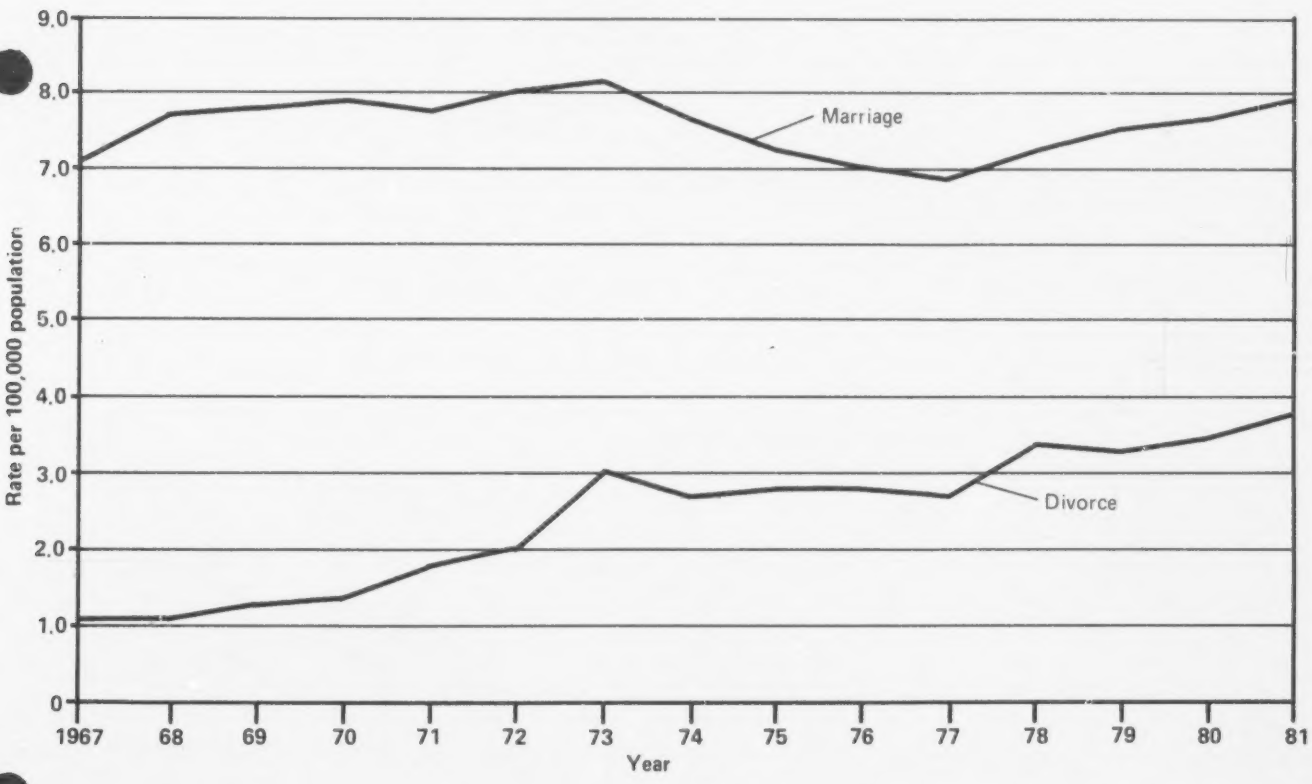
Marriage

The number of marriages performed in New Jersey in 1981 increased for the fourth consecutive year to the highest level since 1973. The number of marriages increased 2,216 to 58,010 pushing the rate per 1,000 population up 0.3 points to 7.9. Since the low of 1977, the number of marriages has risen 14.5 percent and the rate per 1,000 population has increased one full point. Nationally, the marriage rate in 1981 was 10.6, unchanged from the previous year.

By county, the greatest number of marriages occurred in Essex - 6,778. Cape May County reported the highest marriage rate - 9.2. Other counties reported marriages ranging from a low of 471 in Salem to a high of 6,633 in Bergen and rates ranging from 6.7 in Sussex to 8.6 in Atlantic.

Average age at marriage increased for both men and women. For women the average rose 0.8 to 26.6 years while for men the average age rose 0.4 to 29.4 years. The increase in 1981 reversed the preceding two-year decline. Average age at first marriage remained unchanged from 1980 for both men and women. The first marriage average age for men remained at 25 years and for women it remained at 23 years.

MARRIAGE AND DIVORCE RATES
1967 - 1981



The number of men and women marrying before age 25 continued to decline. In 1981 51.2% of the women married were under age 25 compared to 54.1% in 1980 and 72.1% in 1970. The percentage of men marrying before age 25 was 35.8% in 1981, down from 38.2% in 1980 and 57.3% in 1970. The number of teenage brides continued to trend downward, comprising 11.1 percent of all brides in 1981.

Data for previous marital status show little change in the proportion of men previously wed but a continuation of the increase in the proportion of women remarrying. In 1981, 27.9% of the men had been married before, a 0.5% increase from the previous year. Over one-fourth of the women (25.3%) marrying in 1981 had been married before, an increase of 0.6% from 1980 and the highest proportion on record. Sixty-two percent of the marriages were between persons marrying for the first time.

Dissolution of Marriage

For every two marriages contracted in 1981, one was dissolved. There were 27,852 divorces and annulments during the 1980-81 court year*, 2,069 more than the previous year, and the highest annual total on record. Divorces increased at twice the rate of marriages (eight percent vs. four percent) over the year.

The marriage dissolution rate, the number of dissolutions per 1,000 population, reached 3.8, the highest rate on record, in 1981. In the fifteen year period, 1967-1981 the divorce rate has more than tripled. Among counties in New Jersey, Atlantic (4.8) and Hunterdon (5.0) registered the highest marriage dissolution rates in 1981.

*Court year: Sept. 1, 1980 - Aug. 31, 1981

INTRODUCTION

This report is part of the twentieth series of annual reports summarizing vital statistics in the State of New Jersey.

Statistics provided in this publication are summarized from death statistics filed with the New Jersey State Registrar as required by New Jersey vital statistics legislation. Death to New Jersey residents occurring out of State are recorded in the state of occurrence and forwarded to the New Jersey State Registrar. All individual identifiers are removed prior to tabulation of data for statistical purposes.

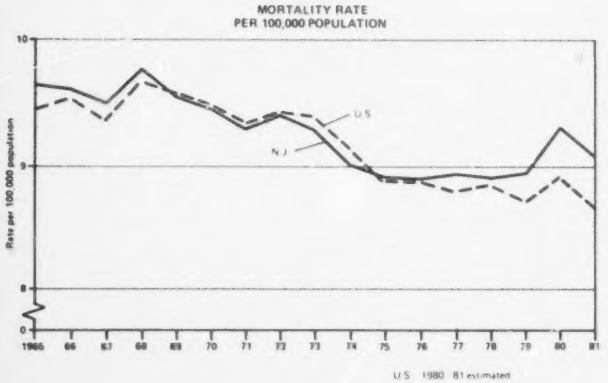
Mortality Rate

There were 67,053 New Jersey resident deaths in 1981, a decrease of 1,709 from the previous year. The mortality rate, the ratio of deaths to population size, was 910.4 deaths per 100,000 population, down from 933.7 the previous year.

The mortality rate for males was higher than the rate for females, 986.4 vs. 840.4. Although the rate for males has been historically higher than the rate for females, the difference between the two rates has been growing smaller. The difference between male and female mortality rates was 248.9 in 1960, 233.0 in 1970, and 146.0 in 1981. While both rate series have declined, a steeper drop in the male rate has caused the gap between the two series to narrow.

The white mortality rate was 974.2, 387.5 points higher than the nonwhite mortality rate of 586.7.

For males, age-specific mortality rates were higher for all age groups than the corresponding rates for females. In the 15-44 age group the mortality rate for males was more than twice the rate for females.



Leading Causes

In 1981, the ten leading causes of death were: (1) diseases of the heart, (2) malignant neoplasms, (3) cerebrovascular disease, (4) accidents, (5) pneumonia and influenza, (6) diabetes mellitus, (7) chronic liver disease and cirrhosis, (8) arteriosclerosis, (9) nephritis, nephrotic syndrome, and nephrosis, (10) other diseases of arteries, arterioles and capillaries. Mortality rates for eight of the ten leading causes of death were part of the decline in the total mortality rate. The two causes of death to register increased rates over the year were malignant neoplasms (+3.2) and accidents (+0.7). Deaths from malignant neoplasms rose to 23.5 percent of all deaths. The portion of total deaths caused by cancer has steadily increased. In 1960, 18% of total deaths were caused by cancer. By 1970 that portion had increased to 19.5 percent of the total.

Rate by age groups show accidents were the leading cause of death for the population under 45 years of age. Diseases of the heart were the leading cause of death for persons 45 years of age and older. The second leading cause of death was malignant neoplasms for the population 5-14 years and 25 years and over. In the 15-24 year age group homicide and legal intervention were the second leading cause of death.

Infant Deaths

Infant mortality refers to deaths of persons under one year of age and is usually measured relative to the number of live births recorded during the same year. In 1981, the number of infant deaths declined to 1,016 from the previous year's level of 1,201, a decrease of 185 to the lowest level as recorded. The infant mortality rate dropped 1.9 points to 10.6 per 1,000 live births from 1980 to 1981, showing the second largest drop to the lowest rate on record.

Counties with the highest infant death rates were Essex (14.8), Salem (14.8), and Mercer (14.4). Twice as many counties posted lower than higher infant death rates over the year. Leading in falling rates were Cumberland (-5.7) and Union (-4.4). Counties showing increase were mostly small changes. The largest increase occured in Salem (+2.7).

There were 656 white infant deaths and 354 nonwhite infant deaths. The infant mortality rate for whites was 8.9, a decrease of 1.4 from the 1980 rate of 10.3 infant deaths per 1,000 live births.

Neonatal Deaths

Most infant deaths occur during the first month of life and are referred to as neonatal deaths. In 1981 there were 700 neonatal deaths, a decline of 129 from the number reported in 1980. The neonatal mortality rate declined to 7.3 per 1,000 live births, a drop of 1.3 percentage points to the lowest level on record.

White neonatal deaths numbered 471 while nonwhite neonatal deaths totaled 225. The neonatal mortality rates for whites and nonwhites were 6.4 and 11.0, respectively. The rate for whites decreased 1.2 per 1,000 live births while the rate for nonwhites declined 1.7 from 1980 levels of 7.6 and 12.7, respectively.

Fetal Deaths

A fetal death is defined as a death occurring prior to complete expulsion or extraction of a fetus from its mother. Fetal deaths occurring after twenty weeks gestation are required by law to be reported to the State Registrar.

Fetal deaths in 1981 numbered 920, slightly less than the number reported in 1980, when 925 such deaths were reported. The fetal death rate, the number of fetal deaths per 1,000 live births, remained unchanged over the year at 9.6

The number of white fetal deaths increased from 571 in 1980 to 596 in 1981 while nonwhite fetal deaths decreased from 327 to 305 during the year. The fetal death rate for the white population increased 0.3 points to 8.0 in 1981. For the nonwhite population the rate declined 0.8 to 14.9 in 1981.

Perinatal Deaths

Perinatal mortality is a composite statistics used to measure the critical period in human development just prior to birth and shortly thereafter. Perinatal mortality, as presented in this report includes fetal deaths and neonatal deaths. There were 1,620 perinatal deaths in 1981, a decrease of 134 from the number reported in 1980. The perinatal mortality rate fell from 18.0 to 16.7, a decline of 1.3 points to the lowest rate on record. Rates for whites and nonwhites were recorded as 14.4 and 26.0, respectively.

Maternal Deaths

There was a slight increase in the number of reported maternal deaths in 1981 which increased by 2 to a total of 7 in 1981.

DEFINITIONS

Age-Specific Mortality Rate - the number of deaths of persons of a given age group per 100,000 estimated persons in that age group usually expressed as an annual rate.

Cause Group - a summary of deaths resulting from, or cases of, related diseases as defined by the International Classification of Diseases Adapted For Use in the United States, published by the U. S. Department of Health, Education, and Welfare; usually specified by a series of 3-digit codes i.e. 140-208 - malignant neoplasms.

Estimated Population - the estimated number of persons in a given group based on the latest census data and adjusted for annual births, annual deaths and net migration.

Fetal Death - a death prior to complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of pregnancy also known as a stillbirth. The death of an infant that has breathed or shown other evidence of life, no matter for how short a period, should be reported as a live birth and an infant death.

Fetal Death Rates - the number of fetal deaths occurring in the twentieth week of gestation or later (required by law to be registered as fetal deaths) per 1,000 live births, usually expressed as an annual rate.

Infant Death - the death of a baby under one year of age, no matter how short a period a time the baby breathed or shown other evidence of life.

Infant Mortality Rate - the number of infant deaths per 1,000 live births, usually expressed as an annual rate.

ICD 9 Code - a listing of disease classifications known as the "Ninth Revision International Classification of Diseases Adapted For Use in the United States", published by the United States Department of Health, Education, and Welfare, used in the statistical coding and tabulation of specific disease morbidity and mortality.

Maternal Death - a death of a woman occurring during the period of pregnancy or following delivery of the infant and related to the pregnancy or delivery of the infant.

Maternal Mortality Rate - the number of maternal deaths per 10,000 live births, usually expressed as an annual rate.

Mortality - the number of deaths.

Neonatal - of, relating to, or affecting the newborn and especially the human infant during the first month of life.

Neonatal Mortality Rate - as used in this text, the number of deaths of infants under 28 days of age per 1,000 live births, per year.

Perinatal - of, relating to, or affecting the fetus and the newborn, especially the human infant during the first month of life.

Perinatal Mortality Rate - the number of deaths of infants less than 28 days of age, and registered fetal deaths per 1,000 live births plus registered fetal deaths.

Race-Specific Mortality Rate - the number of deaths in a given ethnic group per 100,000 estimated population in that ethnic group.

Sex-Specific Mortality Rate - the number of deaths of males/females per 100,000 estimated males/females in the population.
